

Chapter 1

Introduction

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

*Computer Networking: A
Top-Down Approach*
8th edition
Jim Kurose, Keith Ross
Pearson, 2020

Chapter 1: introduction

Chapter goal:

- Get “feel,” “big picture,” introduction to terminology

- more depth, detail *later* in course

Approach:

- use Internet as example

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Overview/roadmap:

- What *is* the Internet?
- What *is* a protocol?
- Network edge: hosts, access network, physical media
- Network core: packet/circuit switching, Internet structure
- Performance: loss, delay, throughput
- Security
- Protocol layers, service models
- History

The Internet: a “nuts and bolts” view

Billions of connected computing *devices*:

- *hosts* = end systems
- running *network apps* at Internet's “edge”

Packet switching: forward packets (chunks of data)

- routers, switches

Communication links

- fiber, copper, radio, satellite
- transmission rate: *bandwidth*

Networks

- collection of devices, routers, links: managed by an organization

“Fun” Internet-connected devices

Amazon Echo

Internet refrigerator

Security Camera

Internet phones

IP picture frame

Slingbox: remote
control cable TV

sensorized,
bed
mattress

Pacemaker & Monitor

Assignment Project Exam Help

Add WeChat powcoder

Web-enabled toaster +
weather forecaster

AR devices

Fitbit

Tweet-a-watt:
monitor energy use

Others?

The Internet: a “nuts and bolts” view

- *Internet: “network of networks”*

- Interconnected ISPs

- *protocols are everywhere*

- control sending, receiving messages
 - e.g., HTTP (Web), streaming video, Skype, TCP, IP, WiFi, 4G, Ethernet

- *Internet standards*

- RFC: Request for Comments
 - IETF: Internet Engineering Task Force

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

The Internet: a “service” view

- *Infrastructure* that provides services to applications:
 - Web, streaming video, multimedia teleconferencing, email, games, e-commerce, social media, interconnected appliances, ...
- provides *programming interface* to distributed applications:
 - “hooks” allowing sending/receiving apps to “connect” to, use Internet transport service
 - provides service options, analogous to postal service

What's a protocol?

Human protocols:

- “what’s the time?”
- “I have a question”
- introductions

... specific messages sent
... specific actions taken
when message received,
or other events

Network protocols:

- computers (devices) rather than humans

~~Assignment Project Exam Help~~
all communication activity in Internet

governed by protocols

<https://powcoder.com>

Add WeChat powcoder

*Protocols define the **format, order** of
messages sent and received among
network entities, and **actions taken**
on msg transmission, receipt*

What's a protocol?

A human protocol and a computer network protocol:

Q: other human protocols?

Chapter 1: roadmap

- What *is* the Internet?
- What *is* a protocol?
- Network edge: ~~Assignment Project Exam Help~~
physical media <https://powcoder.com>
- Network core: packet/circuit switching, internet structure ~~Add WeChat powcoder~~
- Performance: loss, delay, throughput
- Security
- Protocol layers, service models
- History

A closer look at Internet structure

Network edge:

- hosts: clients and servers
- servers often in data centers

A closer look at Internet structure

Network edge:

- hosts: clients and servers
- servers often in data centers

Assignment Project Exam Help

<https://powcoder.com>

Access networks, physical media:

- wired, wireless communication links

Add WeChat powcoder

A closer look at Internet structure

Network edge:

- hosts: clients and servers
- servers often in data centers

Assignment Project Exam Help

<https://powcoder.com>

Access networks, physical media:

Add WeChat powcoder

- wired, wireless communication links

Network core:

- interconnected routers
- network of networks

Access networks and physical media

*Q: How to connect end systems
to edge router?*

- residential access networks
- institutional access networks (school, company)
- mobile access networks (WiFi, 4G/5G)

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

What to look for:

- transmission rate (bits per second) of access network?
- shared or dedicated access among users?

Access networks: cable-based access

frequency division multiplexing (FDM): different channels transmitted in different frequency bands

Access networks: cable-based access

- HFC: hybrid fiber coax
 - asymmetric: up to 40 Mbps – 1.2 Gbps downstream transmission rate, 30-100 Mbps upstream transmission rate
- network of cable, fiber attaches homes to ISP router
 - homes *share access network* to cable headend

Access networks: digital subscriber line (DSL)

- use *existing* telephone line to central office DSLAM
 - data over DSL phone line goes to Internet
 - voice over DSL phone line goes to telephone net
- 24-52 Mbps dedicated downstream transmission rate
- 3.5-16 Mbps dedicated upstream transmission rate

Access networks: fiber to the home (FTTH)

- simple in principle
 - an optical fiber path is run from the central office (CO) to the home, giving access rates in the Gbps range
 - fiber could run direct from the CO to each home, but more often is split close to the home and only from the splitter are there customer-specific fibers
 - terminators at each end convert optical and electrical signals to connect with other gear

Access networks: home networks

Wireless access networks

Shared *wireless* access network connects end system to router

- via base station aka “access point”

Wireless local area networks (WLANs)

- typically within or around building (~100 ft)
- 802.11a/b/g/n/ac/ax (WiFi).
10 Mbps - 10 Gbps

Assignment Project Exam Help

Wide-area cellular access networks

- provided by mobile, cellular network operator (10's km)
- 10's Mbps
- 4G cellular networks (5G coming)

Access networks: enterprise networks

Add WeChat powcoder

- companies, universities, etc.
- mix of wired, wireless link technologies, connecting a mix of switches and routers (we'll cover differences shortly)
 - Ethernet: wired access at 100Mbps, 1Gbps, 10Gbps
 - WiFi: wireless access points at various speeds

Host: sends *packets* of data

host sending function:

- takes application message
 - breaks into smaller chunks, known as *packets*, of length L bits
 - transmits packet into access network at *transmission rate* R
 - link transmission rate, aka link *capacity, aka link bandwidth*
- 
- The diagram illustrates the host sending function. A laptop labeled "host" is shown sending two packets, each of length L bits, over a link with transmission rate R . The packets are represented by blue arrows originating from the laptop. The link is a horizontal line connecting the laptop to a router or switch. The text "Assignment Project Exam Help" and "https://powcoder.com" are overlaid in red, along with a WeChat QR code.

$$\text{packet transmission delay} = \frac{\text{time needed to transmit } L\text{-bit packet into link}}{R \text{ (bits/sec)}} = \frac{L \text{ (bits)}}{R \text{ (bits/sec)}}$$

Links: physical media

- **bit**: propagates between transmitter/receiver pairs
- **physical link**: what is between transmitter & receiver
- **guided media**:
 - signals propagate in solid media: copper, fiber, coax
- **unguided media**:
 - signals propagate freely, e.g., radio

Twisted pair (TP)

- two insulated copper wires
 - Category 5: 100 Mbps, 1 Gbps Ethernet
 - Category 6: 10Gbps Ethernet

<https://powcoder.com>

Add WeChat powcoder

Links: physical media

Coaxial cable:

- two concentric copper conductors
- bidirectional
- broadband:
 - multiple frequency channels on cable
 - 100's Mbps per channel

Fiber optic cable:

- glass fiber carrying light pulses, each pulse a bit
- high-speed operation:
 - high-speed point-to-point transmission (10's-100's Gbps)
- low error rate:
 - repeaters spaced far apart
 - immune to electromagnetic noise

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Links: physical media

Wireless radio

- signal carried in electromagnetic spectrum
- no physical “wire”
- broadcast and “half-duplex” (sender to receiver)
- propagation environment effects:
 - reflection
 - obstruction by objects
 - interference

Radio link types:

- terrestrial microwave
 - up to 45 Mbps channels
- Wireless LAN (WiFi)
- wide-area (e.g., cellular)
 - 4G cellular: ~ 10's Mbps
- satellite
 - up to 45 Mbps per channel
 - 270 msec end-end delay
 - geosynchronous versus low-earth-orbit

Assignment Project Exam Help

Add WeChat powcoder

Chapter 1: roadmap

- What *is* the Internet?
- What *is* a protocol?
- Network edge: ~~Assignments Project Exam Help~~
physical media <https://powcoder.com>
- Network core: packet/circuit switching, internet structure [Add WeChat powcoder](#)
- Performance: loss, delay, throughput
- Security
- Protocol layers, service models
- History

The network core

- mesh of interconnected routers
- packet-switching: hosts break application-layer messages into *packets*
 - forward packets from one router to the next, across links on path from source to destination
 - each packet transmitted at full link capacity

Assignment Project Exam Help
<https://powcoder.com>

Add WeChat powcoder

Packet-switching: store-and-forward

- **Transmission delay:** takes L/R seconds to transmit (push out) L -bit packet into link at R bps
- **Store and forward:** entire packet must arrive at router before it can be transmitted on next link
- **End-end delay:** $2L/R$ (above), assuming zero propagation delay (more on delay shortly)

One-hop numerical example:

- $L = 10 \text{ Kbits}$
- $R = 100 \text{ Mbps}$
- one-hop transmission delay = 0.1 msec

Packet-switching: queueing delay, loss

Packet queuing and loss: if arrival rate (in bps) to link exceeds transmission rate (bps) of link for a period of time:

- packets will queue, waiting to be transmitted on output link
- packets can be dropped (lost) if memory (buffer) in router fills up

Two key network-core functions

Forwarding:

- *local* action:
move arriving
packets from
router's input link
to appropriate
router output link

Routing:

- *global* action:
determine source-
destination paths
taken by packets
- routing algorithms

Alternative to packet switching: circuit switching

end-end resources allocated to,
reserved for “call” between source
and destination

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- in diagram, each link has four circuits.
 - call gets 2nd circuit in top link and 1st circuit in right link.
- dedicated resources: no sharing
 - circuit-like (guaranteed) performance
- circuit segment idle if not used by call (no sharing)
- commonly used in traditional telephone networks

Circuit switching: FDM and TDM

Frequency Division Multiplexing (FDM)

- optical, electromagnetic frequencies divided into (narrow) frequency bands
- each call allocated its own band, can transmit at max rate of that narrow band

Assignment Project Exam Help
<https://powcoder.com>

Add WeChat powcoder

Time Division Multiplexing (TDM)

- time divided into slots
- each call allocated periodic slot(s), can transmit at maximum rate of (wider) frequency band, but only during its time slot(s)

Packet switching versus circuit switching

packet switching allows more users to use network!

Example:

- 1 Gb/s link
- each user:
 - 100 Mb/s when “active”
 - active 10% of time

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- *circuit-switching*: 10 users
- *packet switching*: with 35 users, probability > 10 active at same time is less than .0004 *

Q: how did we get value 0.0004?

Q: what happens if > 35 users ?

* Check out the online interactive exercises for more examples: http://gaia.cs.umass.edu/kurose_ross/interactive

Packet switching versus circuit switching

Is packet switching a “slam dunk winner”?

- great for “bursty” data – sometimes has data to send, but at other times not
 - resource sharing
 - simpler, no call setup
- excessive congestion possible:
<https://powcoder.com> packet delay and loss due to buffer overflow
 - protocols needed for reliable data transfer, congestion control
- Q: How to provide circuit-like behavior?
Add WeChat powcoder
 - bandwidth guarantees traditionally used for audio/video applications

Q: human analogies of reserved resources (circuit switching) versus on-demand allocation (packet switching)?

Internet structure: a “network of networks”

- Hosts connect to Internet via **access** Internet Service Providers (ISPs)
 - residential, enterprise (company, university), commercial) ISPs
- Access ISPs in turn must be interconnected
 - so that any two hosts can send packets to each other
- Resulting network of networks is very complex
 - evolution was driven by **economics** and **national policies**
- Let's take a stepwise approach to describe current Internet structure

Internet structure: a “network of networks”

Question: given *millions* of access ISPs, how to connect them together?

Internet structure: a “network of networks”

Question: given *millions* of access ISPs, how to connect them together?

Internet structure: a “network of networks”

Option: connect each access ISP to one global transit ISP?

Customer and provider ISPs have economic agreement.

Internet structure: a “network of networks”

But if one global ISP is viable business, there will be competitors

Internet structure: a “network of networks”

But if one global ISP is viable business, there will be competitors who will want to be connected

Internet structure: a “network of networks”

... and regional networks may arise to connect access nets to ISPs

Internet structure: a “network of networks”

... and content provider networks (e.g., Google, Microsoft, Akamai) may run their own network, to bring services, content close to end users

Internet structure: a “network of networks”

At “center”: small # of well-connected large networks

- “tier-1” commercial ISPs (e.g., Level 3, Sprint, AT&T, NTT), national & international coverage
- content provider networks (e.g., Google, Facebook): private network that connects its data centers to Internet, often bypassing tier-1, regional ISPs

Chapter 1: roadmap

- What *is* the Internet?
- What *is* a protocol?
- Network edge: ~~Assignments Project Exam Help~~
physical media <https://powcoder.com>
- Network core: packet/circuit
switching, internet structure [Add WeChat powcoder](#)
- Performance: loss, delay, throughput
- Security
- Protocol layers, service models
- History

How do packet loss and delay occur?

packets *queue* in router buffers

- packets queue, wait for turn
- arrival rate to link (temporarily) exceeds output link capacity: packet loss

Packet delay: four sources

$$d_{\text{nodal}} = d_{\text{proc}} + d_{\text{queue}} + d_{\text{trans}} + d_{\text{prop}}$$

d_{proc} : nodal processing

- check bit errors
- determine output link
- typically < msec

d_{queue} : queueing delay

- time waiting at output link for transmission
- depends on congestion level of router

Packet delay: four sources

$$d_{\text{nodal}} = d_{\text{proc}} + d_{\text{queue}} + d_{\text{trans}} + d_{\text{prop}}$$

d_{trans} : transmission delay:

- L : packet length (bits)
- R : link *transmission rate (bps)*
- $d_{\text{trans}} = L/R$

d_{trans} and d_{prop}
very different

d_{prop} : propagation delay:

- d : length of physical link
- s : propagation speed ($\sim 2 \times 10^8$ m/sec)
- $d_{\text{prop}} = d/s$

* Check out the online interactive exercises:
http://gaia.cs.umass.edu/kurose_ross

Caravan analogy

- cars “propagate” at 100 km/hr
- toll booth takes 12 sec to service car (bit transmission time)
- car ~ bit; caravan ~ packet
- **Q:** How long until caravan is lined up before 2nd toll booth?
- **A:** 62 minutes
- time to “push” entire caravan through toll booth onto highway = $12 * 10 = 120 \text{ sec}$
- time for last car to propagate from 1st to 2nd toll both: $100\text{km}/(100\text{km/hr}) = 1 \text{ hr}$

Caravan analogy

<https://powcoder.com>

- suppose cars now “propagate” at 1000 km/hr
 - and suppose toll booth now takes one min to service a car
 - *Q: Will cars arrive to 2nd booth before all cars serviced at first booth?*
- A: Yes!* after 7 min, first car arrives at second booth; three cars still at first booth

Packet queueing delay (revisited)

- R : link bandwidth (bps)
- L : packet length (bits)
- a : average packet arrival rate
- $La/R \sim 0$: avg. queueing delay small
- $La/R \rightarrow 1$: avg. queueing delay large
- $La/R > 1$: more “work” is arriving than can be serviced - average delay infinite!

“Real” Internet delays and routes

- what do “real” Internet delay & loss look like?
- **traceroute** program: provides delay measurement from source to router along end-end Internet path towards destination. For all i :
 - sends three packets that will reach router i on path towards destination (with time-to-live field value of i)
 - router i will return packets to sender
 - sender measures time interval between transmission and reply

Real Internet delays and routes

* Do some traceroutes from exotic countries at www.traceroute.org

Packet loss

- queue (aka buffer) preceding link in buffer has finite capacity
- packet arriving to full queue dropped (aka lost)
- lost packet may be retransmitted by previous node, by source end system, or not at all

Throughput

- *throughput*: rate (bits/time unit) at which bits are being sent from sender to receiver
 - *instantaneous*: rate at given point in time
 - *average*: rate over longer period of time

<https://powcoder.com>

Throughput

$R_s < R_c$ What is average end-end throughput?

$R_s > R_c$ What is average end-end throughput?

— *bottleneck link* —

link on end-end path that constrains end-end throughput

Throughput: network scenario

10 connections (fairly) share
backbone bottleneck link R bits/sec

- per-connection end-end throughput:
 $\min(R_c, R_s, R/10)$
- in practice: R_c or R_s is often bottleneck

* Check out the online interactive exercises for more examples: http://gaia.cs.umass.edu/kurose_ross/

Chapter 1: roadmap

- What *is* the Internet?
- What *is* a protocol?
- Network edge: ~~Assignments Project Exam Help~~
physical media <https://powcoder.com>
- Network core: packet/circuit
switching, internet structure [Add WeChat powcoder](#)
- Performance: loss, delay, throughput
- **Security**
- Protocol layers, service models
- History

Network security

- field of network security:

- how bad guys can attack computer networks
- how we can defend networks against attacks
- how to design architectures that are immune to attacks
<https://powcoder.com>

- Internet not originally designed with (much) security in mind

- *original vision*: “a group of mutually trusting users attached to a transparent network” ☺
- Internet protocol designers playing “catch-up”
- security considerations in all layers!

Bad guys: malware

- malware can get in host from:
 - *virus*: self-replicating infection by receiving/executing object (e.g., e-mail attachment) **Assignment Project Exam Help**
 - *worm*: self-replicating infection by passively receiving object that gets itself executed **https://powcoder.com**
- spyware malware can record keystrokes, web sites visited, upload info to collection site
- infected host can be enrolled in botnet, used for spam or distributed denial of service (DDoS) attacks

Bad guys: denial of service

Denial of Service (DoS): attackers make resources (server, bandwidth) unavailable to legitimate traffic by overwhelming resource with bogus traffic

Assignment Project Exam Help

1. select target <https://powcoder.com>
2. break into hosts around the network
(see botnet)
3. send packets to target from compromised hosts

Bad guys: packet interception

packet “sniffing”:

- broadcast media (shared Ethernet, wireless)
- promiscuous network interface reads/records all packets (e.g., including passwords!) passing by

<https://powcoder.com>

Add WeChat powcoder

Wireshark software used in this course is a (free) packet-sniffer

Bad guys: fake identity

IP spoofing: send packet with false source address

Assignment Project Exam Help

... lots more on security (throughout, Chapter 8)

Chapter 1: roadmap

- What *is* the Internet?
- What *is* a protocol?
- Network edge: ~~Assignments Project Exam Help~~
physical media <https://powcoder.com>
- Network core: packet/circuit
switching, internet structure [Add WeChat powcoder](#)
- Performance: loss, delay, throughput
- Security
- **Protocol layers, service models**
- History

Protocol “layers” and reference models

*Networks are complex,
with many “pieces”:*

- hosts
- routers
- links of various media
- applications
- protocols
- hardware, software

Assignment Project Exam

<https://powcoder.com>

Add WeChat powcoder

Question:

Help
is there any hope of
organizing structure of
network?

.... or at least our
discussion of networks?

Example: organization of air travel

ticket (purchase)
baggage (check)
gates (load)
runway takeoff
airplane routing

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

airplane routing

ticket (complain)
baggage (claim)
gates (unload)
runway landing
airplane routing

airline travel: a series of steps, involving many services

Example: organization of air travel

layers: each layer implements a service

- via its own internal-layer actions
- relying on services provided by layer below

Q: describe in words
the service provided
in each layer above

Why layering?

dealing with complex systems:

- explicit structure allows identification, relationship of complex system's pieces
 - layered *reference model* for discussion
- modularization eases maintenance, updating of system
 - change in layer's service implementation; transparent to rest of system
 - e.g., change in gate procedure doesn't affect rest of system
- layering considered harmful?
- layering in other complex systems?

Internet protocol stack

- *application*: supporting network applications
 - IMAP, SMTP, HTTP
- *transport*: process-process data transfer
 - TCP, UDP
- *network*: routing of datagrams from source to destination
 - IP, routing protocols
- *link*: data transfer between neighboring network elements
 - Ethernet, 802.11 (WiFi), PPP
- *physical*: bits “on the wire”

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

ISO/OSI reference model

Two layers not found in Internet protocol stack!

- *presentation*: allow applications to interpret meaning of data, e.g., encryption, compression, machine-specific conventions
- *session*: synchronization, checkpointing, recovery of data exchange
- Internet stack “missing” these layers!
 - these services, *if needed*, must be implemented in application
 - needed?

The seven layer OSI/ISO reference model

Encapsulation

Assignment Project Exam Help
<https://powcoder.com>

switch

Add WeChat powcoder

- History

Internet history

1961-1972: Early packet-switching principles

- 1961: Kleinrock - queueing theory shows effectiveness of packet-switching
- 1964: Baran - packet-switching in military nets
- 1967: ARPAnet conceived by Advanced Research Projects Agency
- 1969: first ARPAnet node operational
- 1972:
 - ARPAnet public demo
 - NCP (Network Control Protocol) first host-host protocol
 - First e-mail program
 - ARPAnet has 15 nodes

Assignment

<https://powcoder.com>

Add WeChat powcoder

THE ARPA NETWORK

Internet history

1972-1980: Internetworking, new and proprietary nets

- 1970: ALOHAnet satellite network in Hawaii
- 1974: Cerf and Kahn - architecture for interconnecting networks
- 1976: Ethernet at Xerox PARC
- late 70's: proprietary architectures: DECnet, SNA, XNA
- late 70's: switching fixed length packets (ATM precursor)
- 1979: ARPAnet has 200 nodes

Cerf and Kahn's internetworking principles:

- minimalism, autonomy - no internal changes required to interconnect networks
 - best-effort service model
 - stateless routing
 - decentralized control
- define today's Internet architecture

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Internet history

1980-1990: new protocols, a proliferation of networks

- 1983: deployment of TCP/IP
- 1982: SMTP e-mail protocol defined
- 1983: DNS defined for name-to-IP-address translation
- 1985: FTP protocol defined
- 1988: TCP congestion control
- new national networks: CSnet, BIXnet, Eixnet, NSPnet, Minitel
- 100 000 hosts connected to confederation of networks

<https://powcoder.com>

Add WeChat powcoder

NSFNET T1 Network 1991

Internet history

1990, 2000s: commercialization, the Web, new applications

- early 1990s: ARPAnet decommissioned late 1990s – 2000s:
[Assignment Project Exam Help](https://powcoder.com) more killer apps: instant messaging, P2P file sharing
- 1991: NSF lifts restrictions on commercial use of NSFnet (decommissioned, 1995)
<https://powcoder.com> Add WeChat powcoder
 - network security to forefront
 - est. 50 million host, 100 million+ users
 - backbone links running at Gbps
- early 1990s: Web
 - hypertext [Bush 1945, Nelson 1960's]
 - HTML, HTTP: Berners-Lee
 - 1994: Mosaic, later Netscape
 - late 1990s: commercialization of the Web

Internet history

2005-present: more new applications, Internet is “everywhere”

- ~18B devices attached to Internet (2017)
 - rise of smartphones (iPhone: 2007)
- aggressive deployment of broadband access
- increasing ubiquity of high-speed wireless access: 4G/5G, WiFi
- emergence of online social networks:
 - Facebook: ~ 2.5 billion users
- service providers (Google, FB, Microsoft) create their own networks
 - bypass commercial Internet to connect “close” to end user, providing “instantaneous” access to search, video content, ...
- enterprises run their services in “cloud” (e.g., Amazon Web Services, Microsoft Azure)

Chapter 1: summary

We've covered a "ton" of material!

- Internet overview
- what's a protocol?
- network edge, access network, core
 - packet-switching versus circuit-switching
 - Internet structure
- performance: loss, delay, throughput
- layering, service models
- security
- history
